

# DevOps Connect

in association with

**PVG's COET & M  
Department of Computer Engineering**

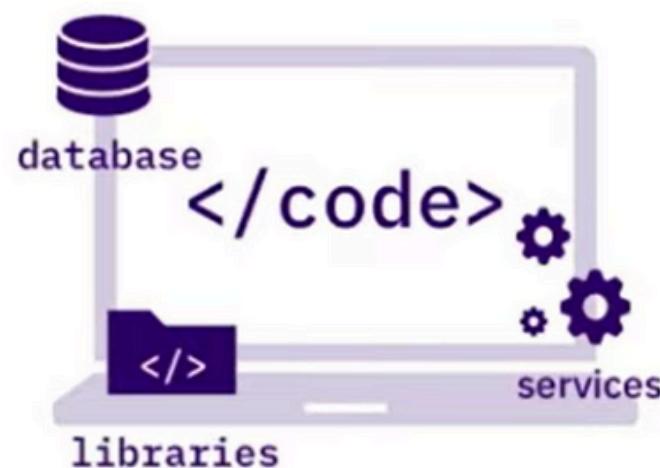

**IT WORKS ON MY MACHINE**

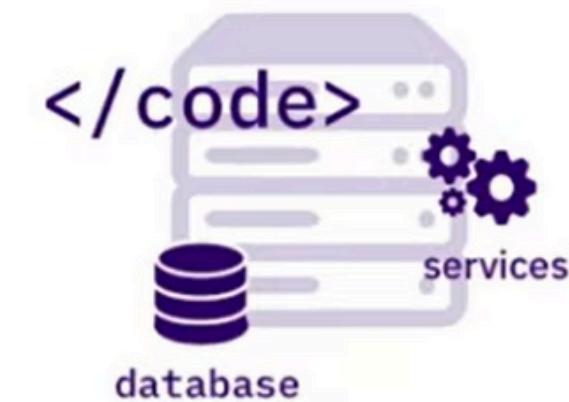

**THEN WE'LL SHIP YOUR MACHINE**

**AND THAT IS HOW DOCKER WAS BORN**

# before

local status: **OK**

server status: **ERROR**  
E: library XYZ missing

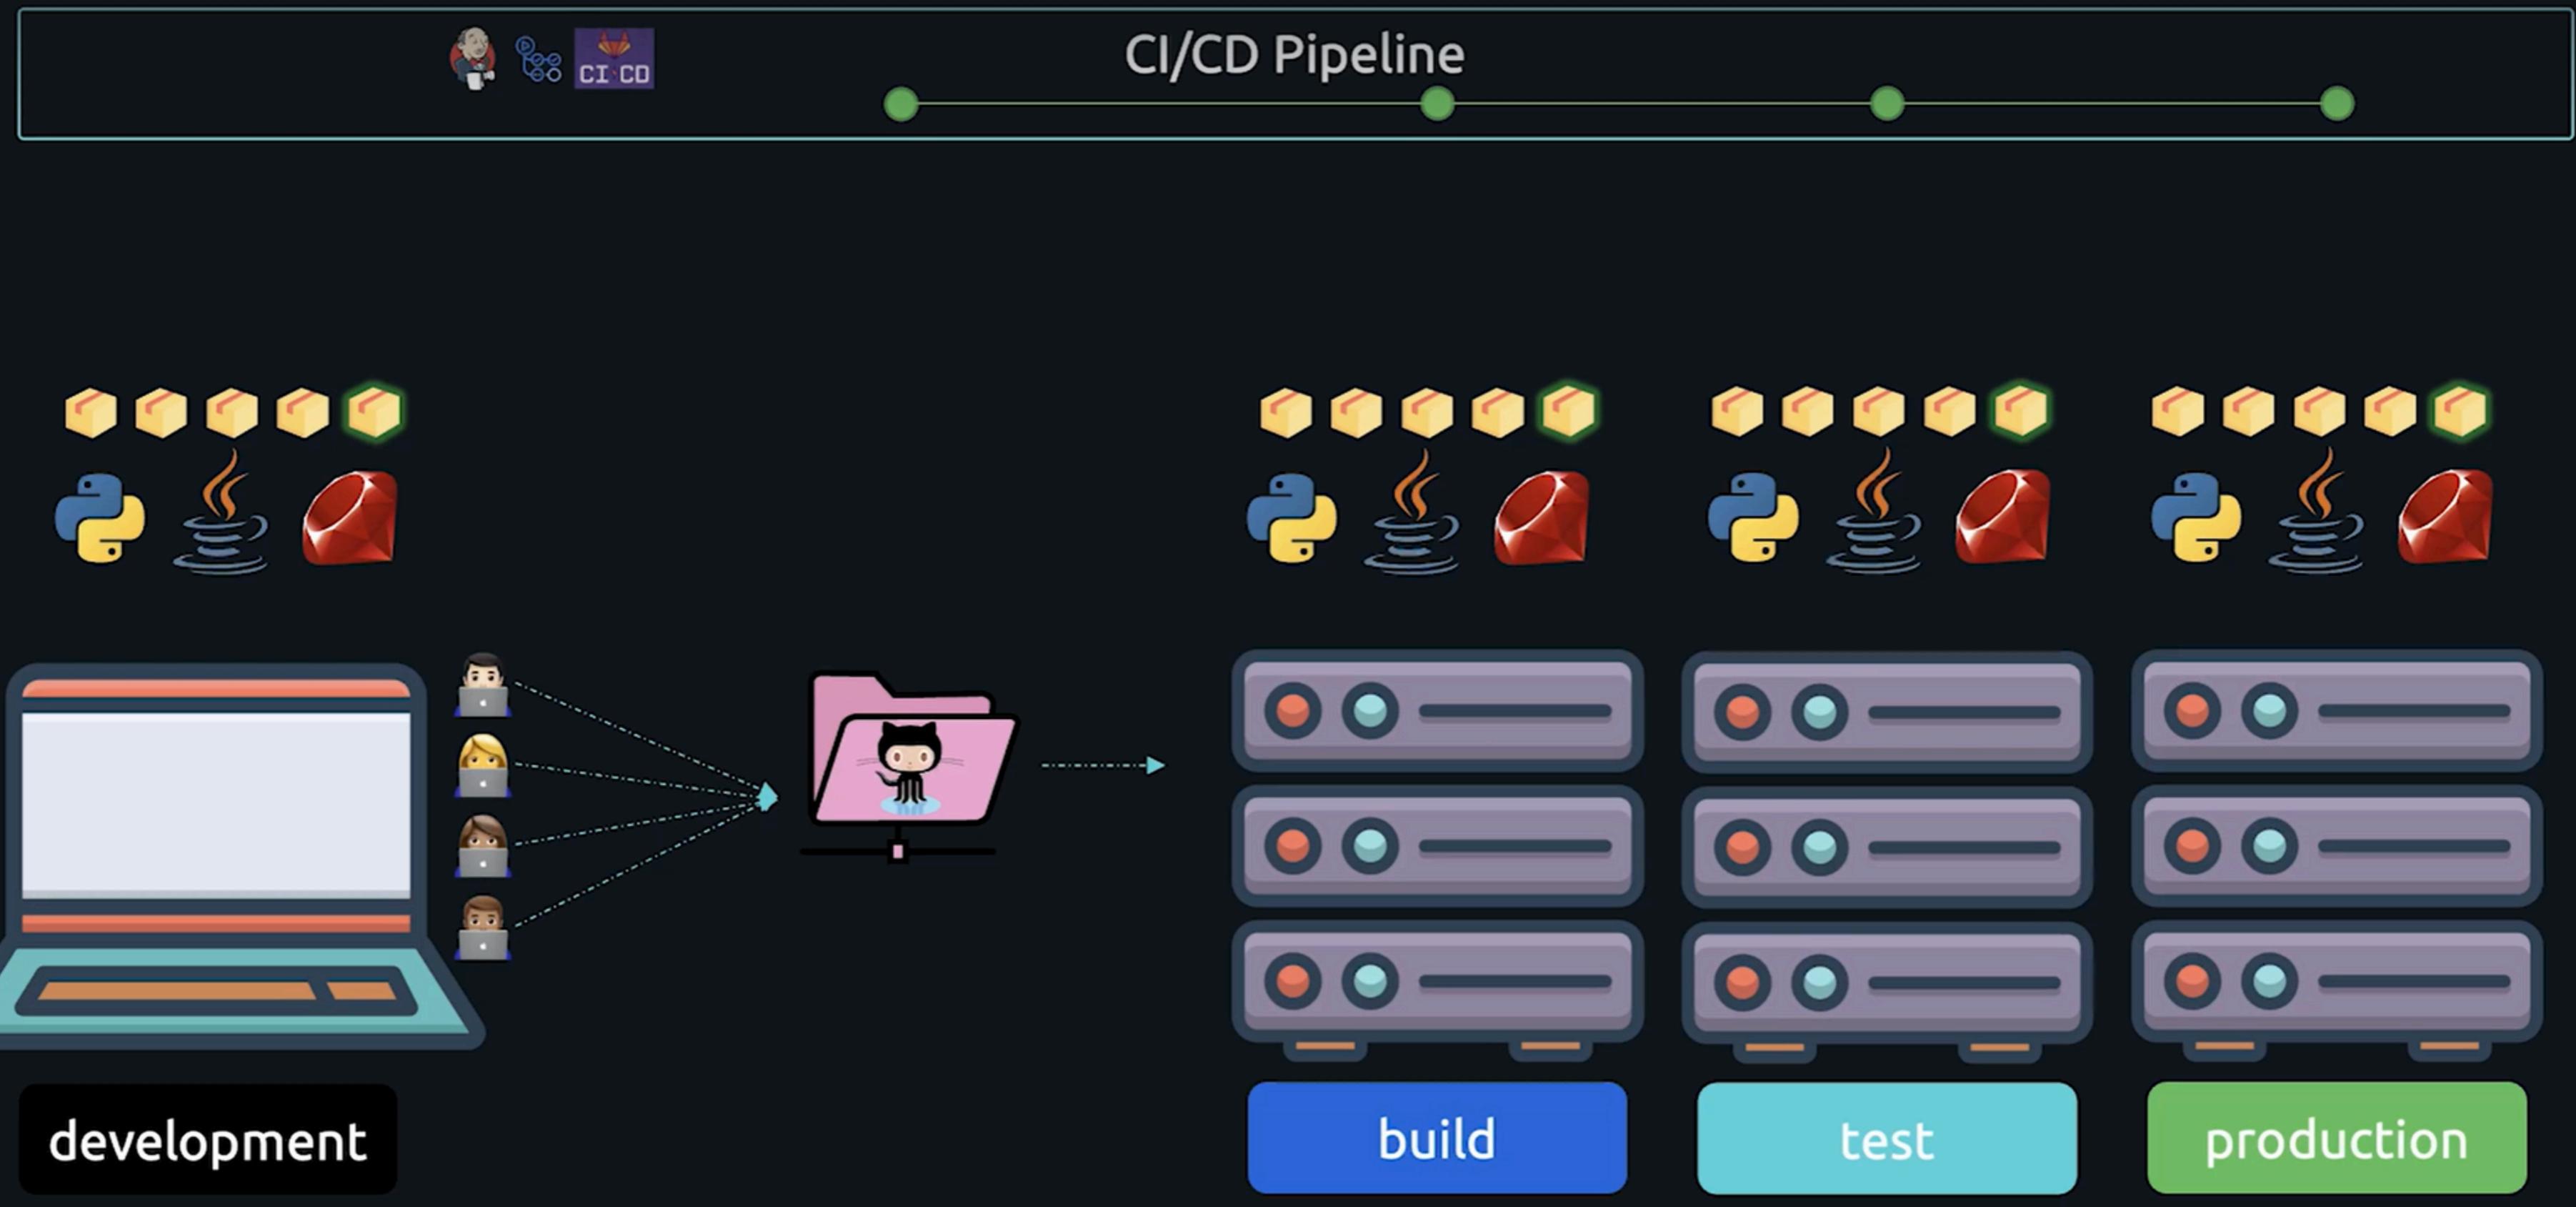

# after

local status: **OK**

server status: **OK**

# CI/CD Pipeline

development

```
>_ $ vi Dockerfile
```

build

```
>_ $ docker build
```

test

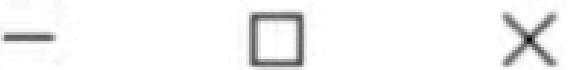

```
>_ $ docker run
```

production

```
>_ $ docker run
```

Machine Virtualization

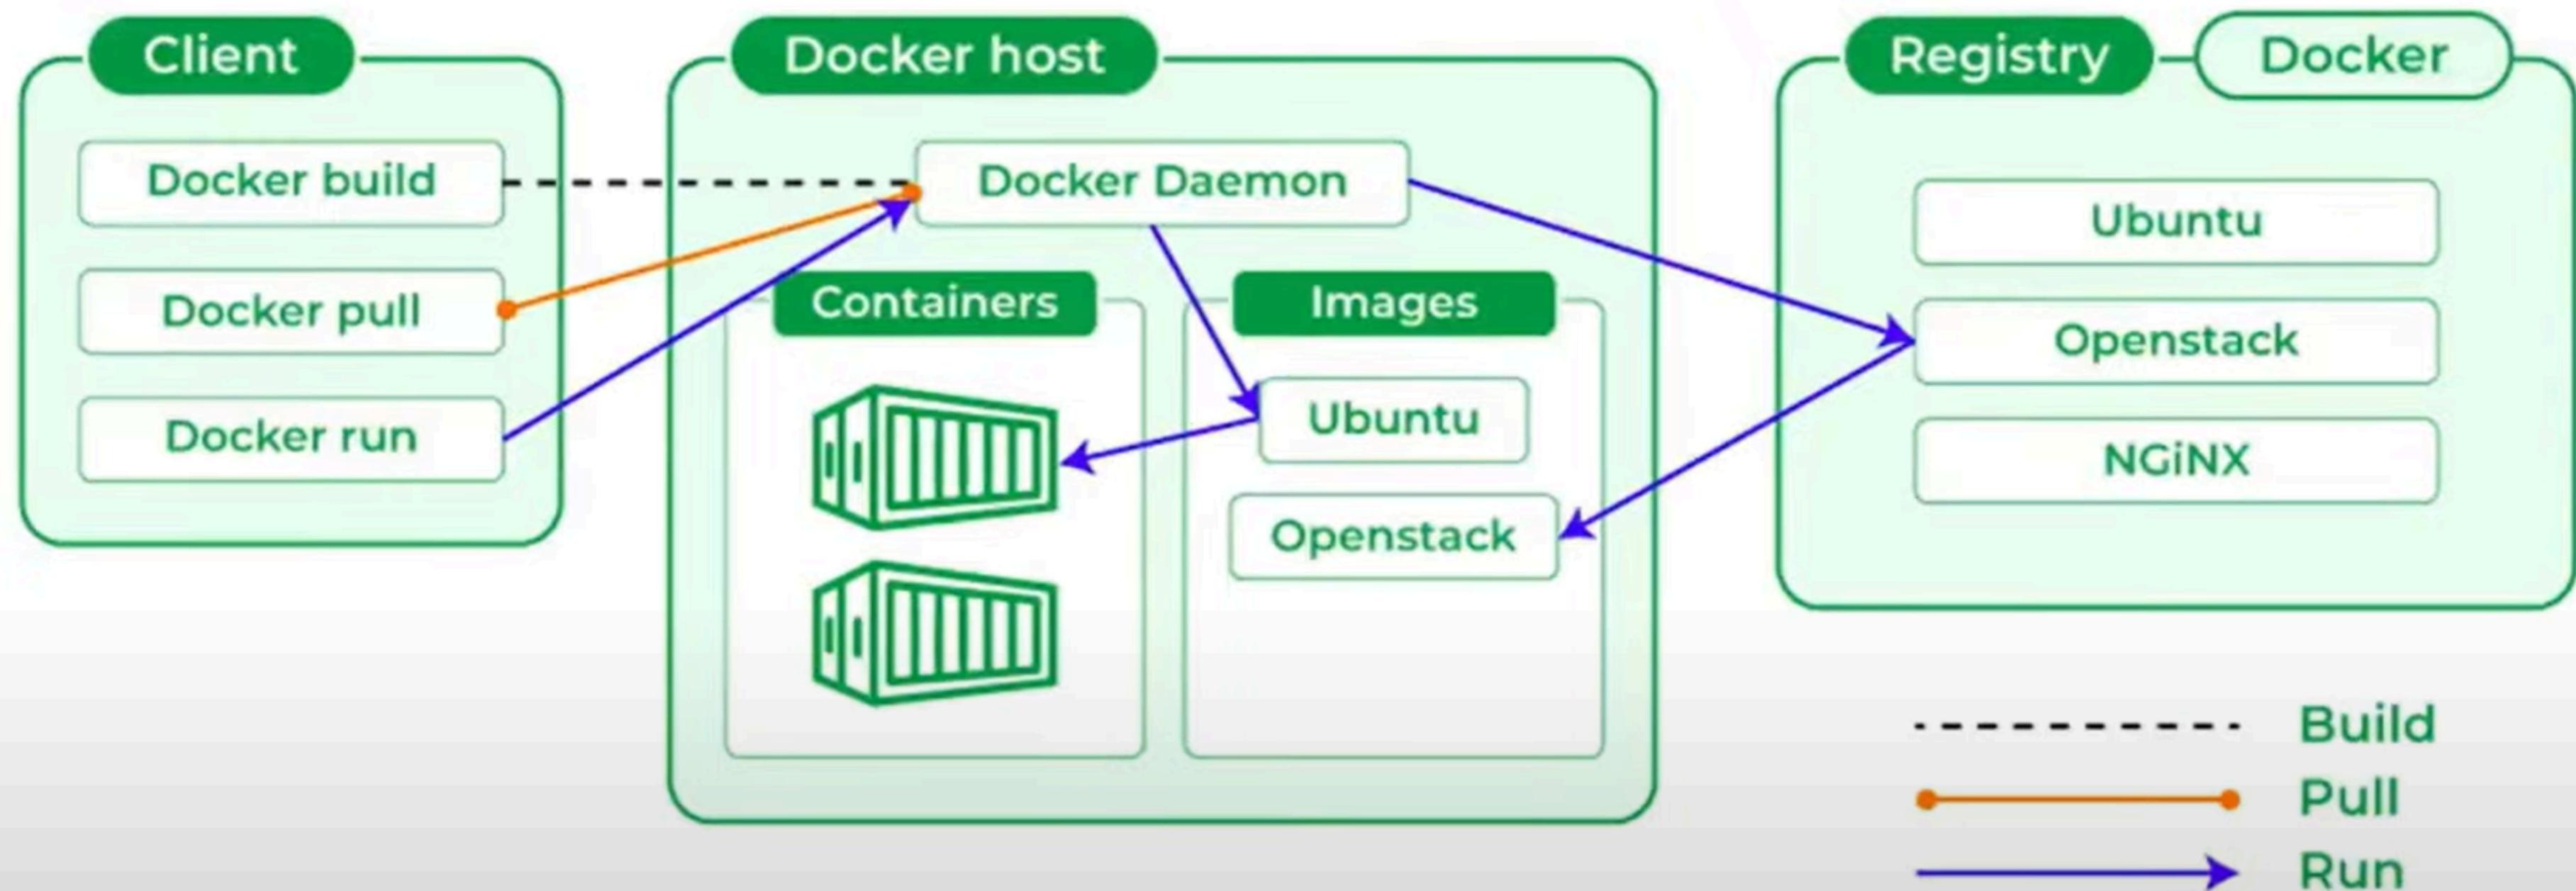

Containers

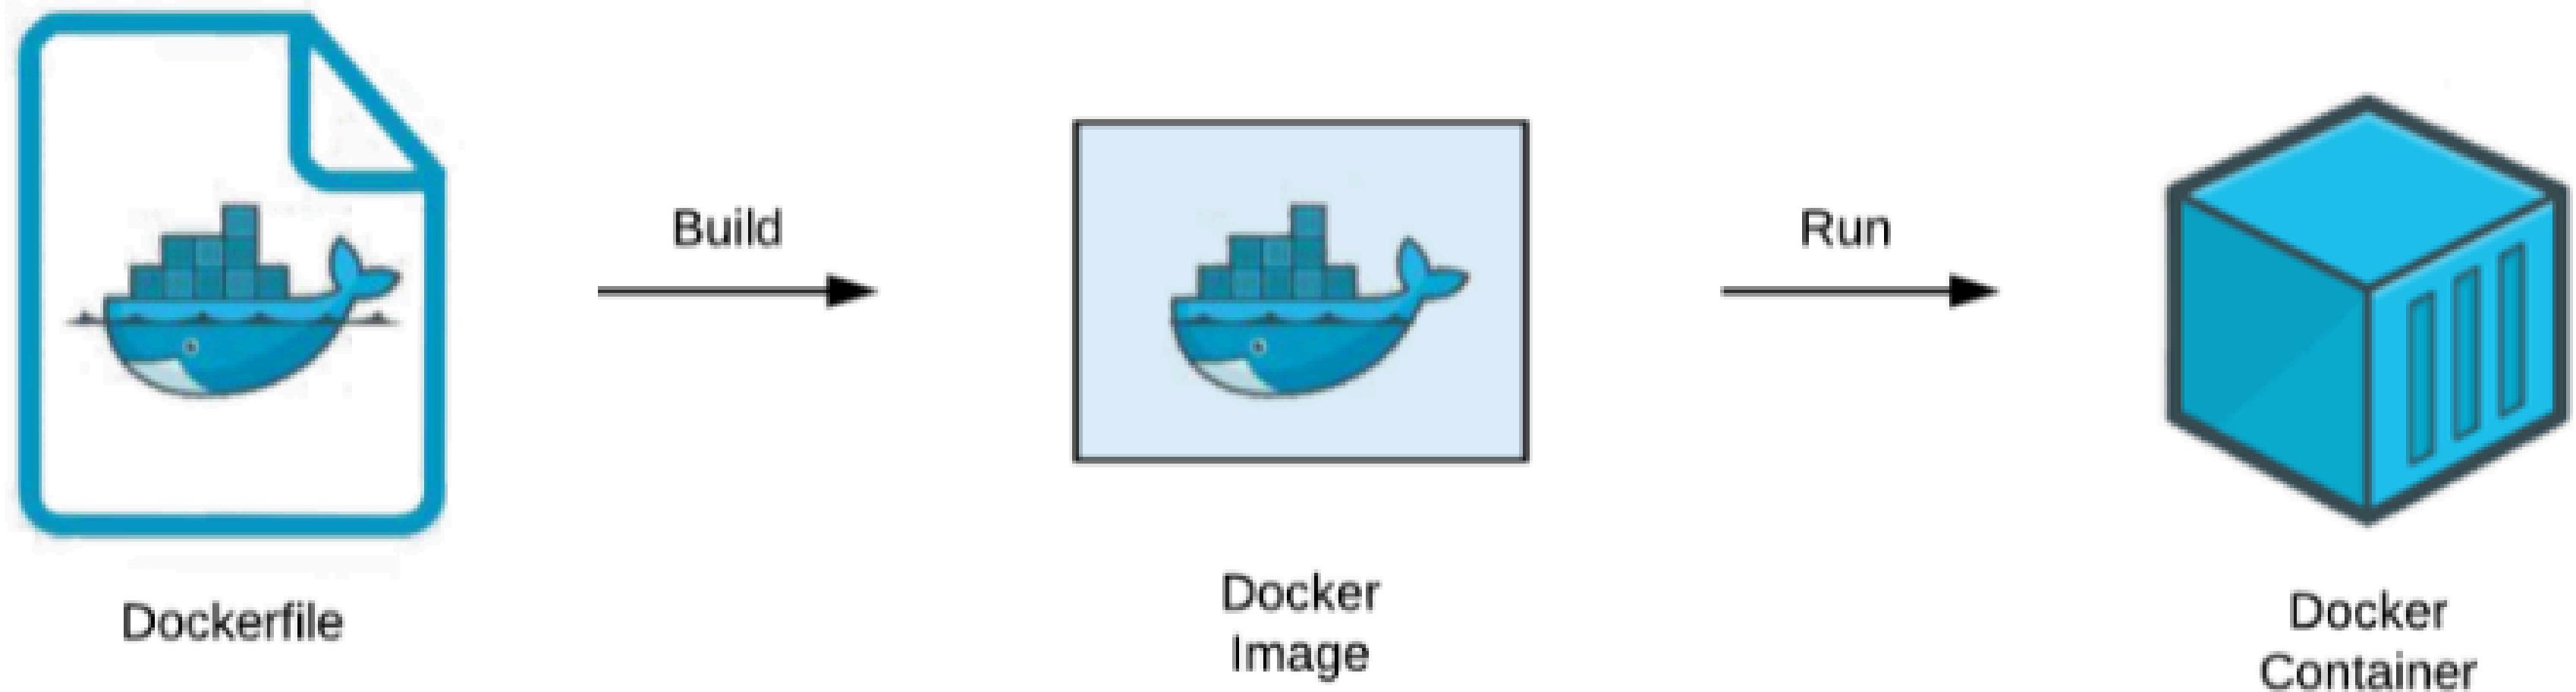

<i>Virtual Machine</i>	<i>Container</i>
Heavyweight	<ul style="list-style-type: none"><li>• Lightweight</li></ul>
Limited performance	<ul style="list-style-type: none"><li>• Native performance</li></ul>
Each VM runs in its own OS	<ul style="list-style-type: none"><li>• All containers share the host OS</li></ul>
Hardware-level virtualization	<ul style="list-style-type: none"><li>• OS virtualization</li></ul>
Startup time in minutes	<ul style="list-style-type: none"><li>• Startup time in milliseconds</li></ul>
Allocates required memory	<ul style="list-style-type: none"><li>• Requires less memory space</li></ul>
Fully isolated and hence more secure	<ul style="list-style-type: none"><li>• Process-level isolation, possibly less secure</li></ul>

# Docker Architecture

Docker uses a client-server architecture to manage and run containers:

```
# Use an official Python base image
FROM python:3.12-slim
```

```
# Set the working directory inside the container
WORKDIR /app
```

```
# Copy only requirements first (better for caching)
COPY requirements.txt .
```

```
# Install dependencies
RUN pip install -r requirements.txt
```

```
# Copy the rest of the application code
COPY ..
```

```
# Expose the port your app listens on (optional but helpful)
EXPOSE 5000
```

```
# Command to run the application
CMD ["python", "app.py"]
```

# BUILD A DOCKER IMAGE

**docker build -t myapp:1.0 .**

## Explanation

**docker build** - Creates an image from a Dockerfile.

**-t myapp:1.0** - Tags the image as myapp with version 1.0.

**.** - The build context (current directory containing the Dockerfile).

# RUN A DOCKER CONTAINER

```
docker run -d -p 8080:80 --name myapp_container myapp:1.0
```

## Explanation

**-d** - Detached mode (runs in background).

**-p 8080:80** - Maps host port 8080 to container port 80.

**--name myapp\_container** - Assigns a custom name.

**myapp:1.0** - Image name and tag to run.

# LIST DOCKER IMAGES

**docker images**

**Explanation**

**Shows all images with repository, tag, ID, size.**

# LIST CONTAINERS

`docker ps`

#Running containers only:

`docker ps -a`

#All containers (including stopped):

Displays container ID, name, image used, status, ports, and more.

```
# Build image from Dockerfile in current directory  
docker build -t mywebapp:latest .
```

```
# Run container in detached mode, expose port 5000 on host  
docker run -d -p 5000:5000 --name web_container mywebapp:latest
```

```
# Verify  
docker images      # List images
```

```
docker ps          # List running containers
```

```
docker ps -a       # List all containers
```

**Thik Hai Bhai**

**Ab Mai Chalta Hoon**

**THANKS :)**
